

Authorization Service Usage

- [Introduction](#)
- [API Usage](#)
- [UI Usage](#)
- [Internal Configuration](#)

Introduction

This service takes an AuthN token and constructs an AuthR token for the same identity. It also adds metadata on the identity (collected from the HAOD). The AuthR token is later used to make policy decisions.

API Usage

We use the *OAuth 2.1 Client Credential Flow*.

<https://swisshds.u.c.bag.admin.ch/authorization/swagger-ui/index.html>

UI Usage

There is no UI.

Internal Configuration

Internally in the Authorization Service one can configure trusted Open ID Connect IDPs. The following 2 env variables are needed for each IDP (with a different number in the env variable name). We have preconfigured Keycloak as indicated below:

```
# Keycloak IDP configuration
SWISSHDS_AUTHORIZATION_IDPS_0_ISSUER = {
  value = "https://swisshds.u.c.bag.admin.ch/keycloak/realms/swiss-hds"
}
SWISSHDS_AUTHORIZATION_IDPS_0_JWKSURI = {
  value = "https://swisshds.u.c.bag.admin.ch/keycloak/realms/swiss-hds/protocol/openid-connect/certs"
}
```
